

Proximity Malt Fall Update 2016

Milwaukee Semi-works Update:

Our malting system has been installed, tweaked and is now operating to produce malt using the same design, processing parameters and control equipment as our plants currently under construction. This will allow us to experiment with recipe design and product development.

We have malted new crop barley from Delaware, and are introducing our first batches of Colorado barley. We will be looking forward to sharing the data, and malt samples, as soon as we have confirmed that our process has been dialed in.

Our top-of-the-line malt lab is also up and running. Ongoing testing is taking place to establish validation standards, and to ensure the repeatability and reproducibility of our analyses.

Orders for 2017:

We are very excited to be taking orders for delivery in the second half of 2017. Our product guide will be attached to this email, please let us know if you are interested in seeing some pricing. If you could let us know the product, packaging requirements and volumes we would be happy to put together a quote. If you have any questions about our product list or schedule, please let us know and we will be pleased to schedule a call to discuss. Contact information is listed to the right.

Construction Progress in Delaware:

October has been all about going vertical. The walls of the Germination Kilning Vessels (GKVs) are rapidly coming together. There will be miles of welding to complete before we are through, and we are thankful that recent weather, although wet and rainy, did not cause any disruptions to our construction schedule. Our next step will be the construction of the steep tank, and the welding of those pieces. Barley bins are also going up! We are still on schedule for startup in the first quarter of 2017, ready to start shipping in spring!

Laurel, DE on Oct. 11 and then Oct. 28, 2016
